ALMO S.r.l.

THE ART OF ALUMINIUM

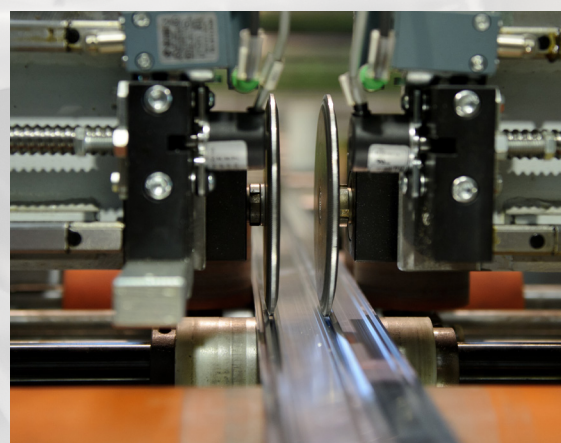

Almo S.r.l. was born in 1992 from a branch of the company Moliser, a firm producing aluminium doors and windows, which has been on the market for over thirty years.

Although it is specialised in the sector of assemblage of bars for thermal profiles, our company structure, together with the productive strength obtained thanks to the partnerships with other firms, leaders in the extrusion and in the different treatments of profiles, such as painting and oxidation, allows us to satisfy every kind of requirements and to follow the customer in his necessities, from the planning phase to the realization and final delivery of aluminium profiles, so that we can **propose ourselves on the market with a finished product**.

At present our firm is working in the seat of Raffa di Puegnago, on an owned area of about 10.000 m², 4.000 m² of which are used as a productive warehouse. Besides, this allows our company to offer a **service of stockpiling and storage** of goods and, along with the excellent relationships with the main bars producers, the possibility for the customers to make use of the direct supply of the polyamide used in the assemblage process.

The assemblage process is **carried out through three complete lines of production**, equipped with different special techniques,

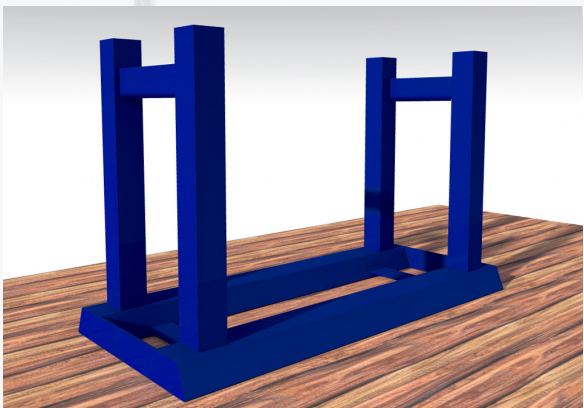

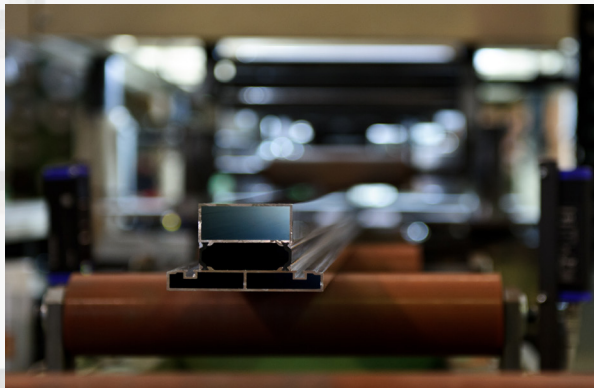

with machines dedicated to the particularities of the profiles. Every phase of the process is subjected to controls and tests: at the receipt and unpacking the profiles are subjected to a visual check, to find possible dents or malformities, and with special instruments, they are measured a first time for the dimensional and hardness correspondence; once they have been assembled, they are tested with special Grip Test belonging to the lines, to verify the resistance and strength, both with the T test with and without heating (with oven with adjustable gradation) and the C test (elastic constant), and then measured again for the dimensional final test. Moreover, in order to meet the increasingly demanding quality requirements, we have installed a new generation **digital microscope**, which guarantees the dimensional control of the profiles with millesimal precision, with the release of a special certified report. All this with the aim to offer a high quality trend service, testified by the attainment of the certification **ISO 9001:2008**, and of the **NF quality mark on the product** (manufacturing) issued by the French Institute CSTB (we are the only ones in Italy).

ALMO S.r.l.

THE ART OF ALUMINIUM

The company has its **own technical office** that, together with the experience developed in the field, can deliver the customers, by means of advice and suggestions, a complete and satisfactory service also in the planning phase and in the realization of profiles to be assembled. The attention paid, in order to solve every kind of problem regarding the service, is shown, for example, by the system our company has conceived for the piling and transport of parcels. In fact, besides meeting the different requirements about package, we have defined in the course of time the **management of the parcel through the use of iron U-bolts**, which allow a fast and tidy piling, quick and less dangerous internal movements and an optimised and safe transport of material. Moreover, to complete in every aspect the offered service, Almo has excellent relationships of preferential cooperation with several carriers on the territory that are differently structured, in order to be able to satisfy the different delivery demands.

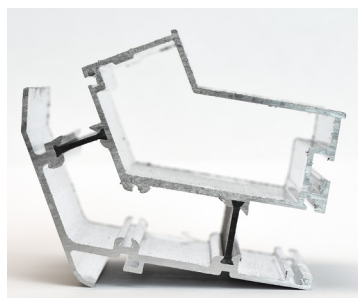

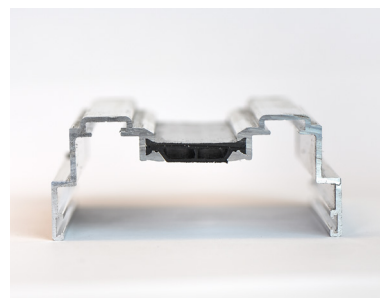

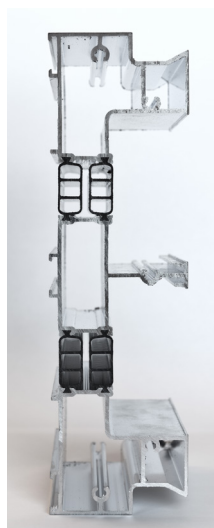

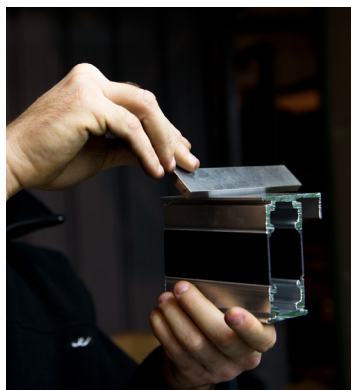

Contacts

This is meant as a short introduction of our small entrepreneurial reality, but we will be grateful if you can dedicate us some moments of your precious time, to meet you personally. We are sure we can offer you a quality service, potentially useful to your requirements, as Almo srl carries out the profiles assemblage as a **“mission with passion!”**
